Statement of Verification

BREG EN EPD No.: 000601 Issue 01

This is to verify that the

Environmental Product Declaration

provided by:

Arab Steel Co (ASCO)

is in accordance with the requirements of:

EN 15804:2012+A2:2019

and

BRE Global Scheme Document SD207

This declaration is for:

Carbon steel feedstock billets manufactured from secondary material (steel scrap) and direct reduced iron (DRI)

Company Address

Arab Steel Co (ASCO)
2nd Industrial City
Dammam
Saudi Arabia

Signed for BRE Global Ltd	Emma Baker Operator	13 June 2024 Date of this Issue
13 June 2024 Date of First Issue		12 June 2027 Expiry Date

Environmental Product Declaration

EPD Number: 000601

General Information

EPD Programme Operator	Applicable Product Category Rules
BRE Global Watford, Herts WD25 9XX United Kingdom	BRE 2023 Product Category Rules (PN 514 Rev 3.1) for Type III environmental product declaration of construction products to EN 15804:2012+A2:2019.
Commissioner of LCA study	**LCA consultant/Tool**

Declared/Functional Unit	**Applicability/Coverage**
The declared unit is 1 tonne of carbon steel feedstock billets manufactured from secondary material (steel scrap) and direct reduced iron (DRI).	Manufacturer-specific product.
EPD Type	**Background database**
Cradle to Gate with Module C and D and Options	GaBi

Demonstration of Verification
CEN standard EN 15804 serves as the core PCR [a]
Independent verification of the declaration and data according to EN ISO 14025:2010 ☐Internal ☒ External
(Where appropriate [b])Third party verifier: Pat Hermon
a: Product category rules b: Optional for business-to-business communication; mandatory for business-to-consumer communication (see EN ISO 14025:2010, 9.4)

Comparability
Environmental product declarations from different programmes may not be comparable if not compliant with EN 15804:2012+A2:2019. Comparability is further dependent on the specific product category rules, system boundaries and allocations, and background data sources. See Clause 5.3 of EN 15804:2012+A2:2019 for further guidance

Saudi Arabia

Construction Product:

Product Description

Carbon steel feedstock billet (according to product standards listed in Summary, comments and additional information) that is obtained from steel scrap and Direct Reduced Iron (DRI) melted in Electric Arc Furnace (EAF).

Steel feedstock billet is produced for hot rolling to obtain reinforcing steel bars for direct use, or to obtain wire rod to produce other reinforcing steels by further processing, or to obtain other forms of structural steels.

The declared unit is 1 tonne of carbon steel feedstock billets manufactured from secondary material (steel scrap) and direct reduced iron (DRI).

Technical Information

Property	Value, Unit
Production route	EAF
Density	7850 kg/m^3
Recycled content (as per ISO 14021:2016/Amd:2021)	50.7 %

Main Product Contents

Material/Chemical Input	%
Fe	97
C, Mn, Si, V, Ni, Cu, Cr, Mo and others	3

Manufacturing Process

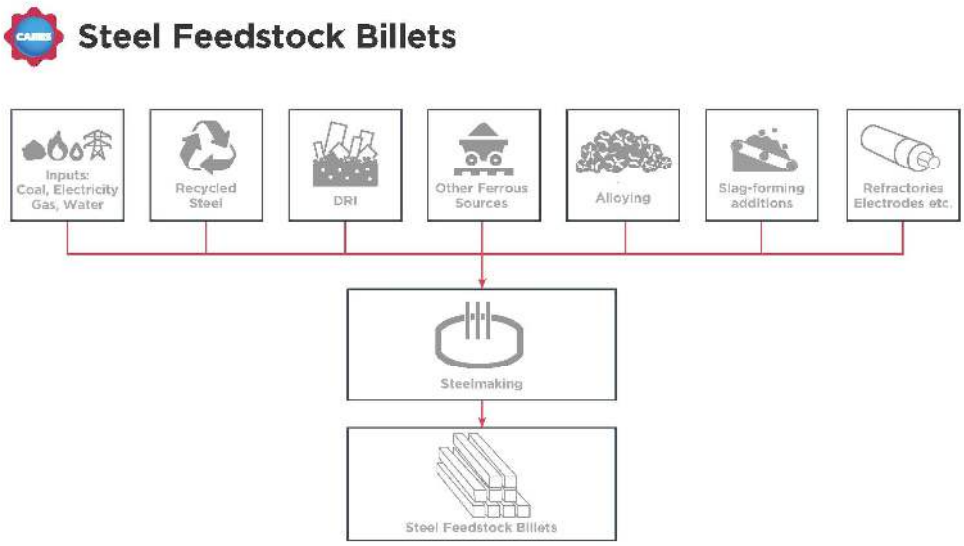
DRI, steel scrap are melted in an Electric Arc Furnace (EAF) to obtain liquid metal. This is then refined to remove impurities and alloying additives can be added to give the required properties of the steel.

Molten steel from the EAF is then cast into steel billets in required dimensions to be used as feedstock for the manufacture of rolled constructional steel products.

Steel billets are hot rolled and shaped to the required dimensions for the finished bars of reinforcing steel bar, coil or rod for the reinforcement of concrete for direct use or wire rod for further processing into other reinforcing standards or other forms of structural steels as used in a built structure.

The carbon steel feedstock billet products may be packaged by binding with steel wire or straps, either of the steel ties and products do not include any biogenic materials.

Process flow diagram



Construction Installation

Processing and proper use of reinforcing steel and structural steel products manufactured from carbon steel feedstock billets depends on the application and should be made in accordance with generally accepted practices, standards and manufacturing recommendations.

During transport and storage of reinforcing steel and structural steel products the usual requirement for securing loads is to be observed.

Use Information

The composition of the reinforcing steel and structural steel products manufactured from carbon steel feedstock billets does not change during use.

Carbon steel reinforcing steel and structural steel products do not cause adverse health effects under normal conditions of use.

No risks to the environment and living organisms are known to result from the mechanical destruction of the reinforcing steel and structural steel product itself.

End of Life

Reinforcing steel and other structural steel products manufactured from carbon steel feedstock billets are not reused at end of life but can be recycled to the same (or higher/lower) quality of steel depending upon the metallurgy and processing of the recycling route.

It is a high value resource, so efforts are made to recycle steel scrap rather than disposing of it at EoL. A recycling rate of 92% is typical for reinforcing steel products

Life Cycle Assessment Calculation Rules

Declared unit description

The declared unit is 1 tonne of carbon steel feedstock billets manufactured from secondary material (steel scrap) and direct reduced iron (DRI) for further processing into steel products for the reinforcement of concrete and into other forms of structural steels as used in a built structure. (i.e. 1 tonne in use, accounting for losses during fabrication and installation, not 1 tonne as produced)

System boundary

The system boundary of the EPD follows the modular design defined by EN 15804+A2. This is a cradle to gate – with options EPD and with options EPD and thus covers modules from A1 to A3, modules from C1 to C4 and module D.

Impacts and aspects related to losses/wastage (i.e. production, transport and waste processing and end-of-life stage of lost waste products and materials) are considered in the modules in which the losses/wastage occur.

Once steel scrap has been collected for recycling it is considered to have reached the end of waste state.

Data sources, quality and allocation

Data Sources: Manufacturing data of the period 01/01/2022-31/12/2022 has been provided by Arab Steel Co (ASCO) (member of CARES).

The selection of the background data for electricity generation is in line with the BRE Global PCR. Country or region specific power grid mixes are selected from GaBi 2021 databases (Sphera 2021); thus, consumption grid mix of Saudi Arabia has been selected to suit specific manufacturing location.

Data Quality: Data quality can be described as good. Background data are consistently sourced from the GaBi 2021 databases (Sphera 2021). The primary data collection was thorough, considering all relevant flows and these data have been verified by CARES.
Data quality level and criteria of the UN Environment Global Guidance on LCA database development:

Geographical Representativeness	: Good
Technical Representativeness	: Very good
Time Representativeness	: Good

Allocation: EAF slag and mill scale are produced as co-products from the steel manufacturing process. Impacts are allocated between the steel, the slag and the mill scale based on economic value. The revenue generated from both mill scale and EAF slag are 0.02% and 0.25% respectively, and their total is less than 1% in relation to the product based on current market prices, these co-products are of definite value and are freely/readily traded in reality. For this reason, economic allocation has been applied to the processes where these co-products arise.

Production losses of steel during the production process are recycled in a closed loop offsetting the requirement for external scrap. Specific information on allocation within the background data is given in the GaBi datasets documentation (/GaBi 6 2021/)

Cut-off criteria

On the input side all flows entering the system and comprising more than 1% in total mass or contributing more than 1% to primary energy consumption are considered. All inputs used as well as all process-specific waste and process emissions were assessed. For this reason, material streams which were below 1% (by mass) were captured as well. In this manner the cut-off criteria according to the BRE guidelines are fulfilled.

The mass of steel wire or strap that may be used for binding the product is less than 1 % of the total mass of the product.

Scenarios and additional technical information

Scenarios and additional technical information			
Scenario	Parameter	Units	Results
C1 to C4 End of life,	The end-of-life stage starts when the construction product is replaced, dismantled or deconstructed from the building or construction works and does not provide any further function. The recovered steel is transported for recycling while a small portion is assumed to be unrecoverable and remains in the rubble which is sent to landfill. 92% of the reinforcing steel is assumed to be recycled and 8% is sent to landfill [STEELCONSTRUCTION.INFO 2012]. Once steel scrap is generated through the deconstruction activities on the demolition site it is considered to have reached the "end of waste" state. No further processing is required so there are no impacts associated with this module. Hence no impacts are reported in module C3.		
	Waste for recycling - Recovered steel from crushed concrete	%	92
	Waste for energy recovery - Energy recovery is not considered for this study as most end of life steel scrap is recycled, while the remainder is landfilled	-	-
	Waste for final disposal - Unrecoverable steel lost in crushed concrete and sent to landfill	%	8
	Portion of energy assigned to rebar from energy required to demolish building, per tonne	MJ	24
	Transport to waste processing by Truck - Fuel consumption	litre/km	1.56
	Transport to waste processing by Truck – Distance	km	463
	Transport to waste processing by Truck – Capacity utilisation	%	85
	Transport to waste processing by Truck – Density of Product	kg/m^3	7850
	Transport to waste processing by Container ship - Fuel consumption	litre/km	0.0041
	Transport to waste processing by Container ship - Distance	km	158
	Transport to waste processing by Container ship – Capacity utilisation	%	50
	Transport to waste processing by Container ship – Density of Product	kg/m^3	7850
Module D	It is assumed that 92% of the steel used in the structure is recovered for recycling, while the remainder is landfilled. "Benefits and loads beyond the system boundary" (module D) accounts for the environmental benefits and loads resulting from net steel scrap that is used as raw material in the EAF and that is collected for recycling at end of life. The balance between total scrap arisings recycled from fabrication, installation and end of life and scrap consumed by the manufacturing process (internally sourced scrap is not included in this calculation). These benefits and loads are calculated by including the burdens of recycling and the benefit of avoided primary production. This study is concerned with using Direct Reduced Iron (DRI) and steel scrap in the EAF in nearly equal proportions. In secondary production route using steel scrap only, more scrap is required as input to the system than is recovered at end of life. In DRI production route only, a large amount of net scrap is generated over the life cycle as the Direct Reduced Iron (DRI) is primarily from virgin sources and there is a high end of life recycling rate for reinforcing steel products. As nearly equal proportions of DRI and steel scrap are used in the production route, the net effect is that module D mainly models the credits associated with the scrap output. The resulting scrap credit/burden is calculated based on the global "value of scrap" approach (/worldsteel 2011).		
	Recycled Content	kg	507
	Re-used Content	kg	0
	Recovered for recycling	kg	920
	Recovered for re-use	kg	0
	Recovered for energy	kg	0

Summary, comments and additional information

Interpretation

Direct Reduced Iron and steel scrap based reinforcing steel product of Arab Steel Co (ASCO) (member of CARES) is made via the EAF route. The bulk of the environmental impacts and primary energy demand is attributed to the manufacturing phase, covered by information modules A1-A3 of EN 15804+A2.

The interpretation of the results has been carried out considering the methodology- and data-related assumptions and limitations declared in the EPD. This interpretation section focuses on the environmental impact categories as well as the primary energy demand indicators only.
